```
New nucleic acid fragment encoding myo-inositol 1-phosphate synthase, useful for producing plants with decreased raffinose, stachyose, and phytic acid and increased sucrose, leading to valuable and useful soybean
Claim 10; SEQ ID NO 11; 48pp; English.
                                                                                        products.
```

results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant comprising the chimeric gene, a method of making the soybean plant, a seed of the soybean plant, a soy protein product derived from the processing of soybean seeds, a method of making or producing a soy protein product and a method of using a soybean plant homozygous for at least one gene encoding a mutant myo-inositol 1-phosphate synthase having decreased capacity for the synthasis of myo-inositol 1-phosphate. The nucleic acid fragment and methods are useful for producing plants with decreased raffinose, stachyose and phytic acid content and increased sucrose and inorganic phosphate content, leading to valuable and useful soybean products. This sequence represents cDNA encoding a mutant soybean myo-inositol 1-phosphate synthase polypeptide of the invention. inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate synthase having a decreased capacity for the synthesis of myo-inositol 1-phosphate. The invention also relates to a chimeric gene operably linked to suitable regulatory sequences, where expression of the chimeric gene invention relates to a nucleic acid fragment encoding a soybean myo-

Soybean myo-inositol 1-phosphate synthase cDNA mutant

```
CC soybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-phosphate. Also included are a chimeric gene (comprising the complement, subfragment or the complement of the subfragment, operably complement, subfragment or the complement of the subfragment, operably complement, subfragment or the complement of the subfragment, operably complement, subfragment or the complement of the subfragment, operably complement or the complement of the subfragment, operably complement, subfragment or the complement of the subfragment, operably complement, subfragment or the subfragment, operably complement, subfragment or the subfragment, operably complement, subfragment or the subfragment, operably complement, subfragment of the chimeric gene (with a heritable phenotype of a seed phytic comprising the chimeric gene (with a heritable phenotype of a seed phytic card content of less than 17 micromol/g, and a seed content of raffinose plus trachyose of less than 17 micromol/g, and a seed content of raffinose plus crossing step than 200 micromol/g, provided that the plant is not LR3), seeds cromprising crossing the plant and selecting a progeny plant of the cross of cromprising step that has a heritable phenotype as mentioned above), seeds of soybean plant and selecting a progeny plant of the cross of crossing step that has a heritable phenotype as mentioned above, seeds of soybean plant (homozygous for one or more gene encoding a complement of product derived from seeds of a soybean plant with heritable phenotype as mentioned above, and making or producing a complement of soybean product derived from seeds of a soybean plant with heritable phenotype as mentioned above, here the gene confers a complement of soybean seeds thus leading to valuable and useful composited in soy plants (and other legumes) can lead to flatulence when consumed by humans. The presence of high concentration of raffinose olimpistical 1-phosphate synthase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a nucleic acid fragment encoding a soybean myo-
cc inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
cc synthase having a decreased capacity for the synthesis of myo-inositol 1-
cc phosphate. The invention also relates to a chimeric gene operably linked
cc results in a decrease in expression of an endogenous or native gene
cc encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant
cc comprising the chimeric gene, a method of making the soybean plant, a
cc seed of the soybean seeds, a method of making the soybean plant, a
cc seed of the soybean seeds, a method of making or producing a soy
cc procesing of soybean seeds, a method of making or producing a soy
cc protein product and a method of using a soybean plant homozygous for at
cleast one gene encoding a mutant myo-inositol 1-phosphate synthase having
cd decreased capacity for the synthesis of myo-inositol 1-phosphate with
cc decreased raffinose, stachyose and phytic acid content and increased
cc sucrose and inorganic phosphate content, leading to valuable and useful
cc soybean myo-inositol 1-phosphate synthase synthase synthase and useful
cc soybean myo-inositol 1-phosphate synthase and useful

CC inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate (CC synthase having a decreased capacity for the synthesis of myo-inositol 1-phosphate (CC propaghate). The invention also relates to a chimeric gene operably linked (CC propaghate) and the regulatory sequences, where expression of the chimeric gene (CC encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant (CC comprising the chimeric gene, a method of making the soybean plant, a (CC processing of soybean seeds, a method of making the soybean plant, a (CC processing of soybean seeds, a method of making or producing a soybean gracticy for the synthase soy protein product and a method of using a soybean plant (CC processing of soybean seeds, a method of making or producing a soybean gracticy for the synthesis of myo-inositol 1-phosphate. The (CC decreased capacity for the synthesis of myo-inositol 1-phosphate. The (CC decreased raffinose, stachyose and phytic acid content and increased (CC surrose and inorganic phosphate content, leading to valuable and useful (CC soybean products. This sequence represents cDNA encoding a mutant soybean (CC myo-inositol 1-phosphate synthase polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       08-APR-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC inositol 1-phosphate synthase (MI 1-PS) present in clone LR33-10. This C clone was isolated from a cDNA library of soybean line LR33 by PCR CC amplification (see AAV62441-42). Line LR33 was obtained by chemical CC mutagenesis of wild-type soybean genome and as a reduced raffinose exactharide phenotype. MI 1-PS is involved in glucose metabolism to phytic CC acid, raffinose and stachyose. Sequencing revealed a single base change CC mutation (G to T at base 1241) in the LR33 sequence when compared to the CC wild-type sequence (see AAV62440). The mutation results in a seed CC phenotype of very low raffinose saccharide sugars, very high sucrose and CC phytic acid. The mutated MI 1-PS nucleic acid is used to alter the CC content of soybean seeds, leading to useful soybean products, e.g. a seed CC phytic acid content of less than 17 ug/g, a seed content of raffinose and CC stachyose combined of less than 14.5 ug/g, and a seed sucrose content CC greater than 200 ug/g.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant comprising the chimeric gene, a method of making the soybean plant, a seed of the soybean plant, a seed of the soybean plant, a soy protein product derived from the processing of soybean seeds, a method of making or producing a soy protein product and a method of using a soybean plant homozygous for at least one gene encoding a mutant myo-inositol 1-phosphate synthase having decreased capacity for the synthasis of myo-inositol 1-phosphate. The nucleic acid fragment and methods are useful for producing plants with decreased raffinose, stachyose and phyric acid content and increased sucrose and inorganic phosphate content, leading to valuable and useful soybean products. This sequence represents cDNA encoding a mutant soybean myo-inositol 1-phosphate synthase polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a nucleic acid fragment encoding a soybean myo-
inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
synthase having a decreased capacity for the synthesis of myo-inositol 1-
phosphate. The invention also relates to a chimeric gene operably linked
to suitable regulatory sequences, where expression of the chimeric gene
results in a decrease in expression of an endogenous or native gene
                                                                                                                  Glycine max.

                                                                                       Ś
                                                                                                                           밁
                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                 The invention relates to a nucleic acid fragment encoding a soybean myo-
CC innositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
CC synthase having a decreased capacity for the synthesis of myo-inositol 1-
CC phosphate. The invention also relates to a chimeric gene operably linked
CC to suitable regulatory sequences, where expression of the chimeric gene
CC results in a decrease in expression of an endogenous or native gene
CC encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant
CC comprising the chimeric gene, a method of making the soybean plant, a
CC seed of the soybean seeds, a method of making the soybean plant, a
CC seed of the soybean seeds, a method of making or producing a soy
CC protein product and a method of using a soybean plant homozygous for at
CC least one gene encoding a mutant myo-inositol 1-phosphate synthase having
CC decreased capacity for the synthesis of myo-inositol 1-phosphate with
CC decreased raffinose, stachyose and phytic acid content and increased
CC sucrose and inorganic phosphate content, leading to valuable and useful
CC sucrose and inorganic phosphate represents CDNA encoding a mutant soybean
CC myo-inositol 1-phosphate synthase polypeptide of the invention.

CC linked to suitable regulatory sequences, where expression of the chimeric compensation and accrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase), a soybean plant cc comprising the chimeric gene (with a heritable phenotype of a seed phytic acid content of less than 17 micromol/g, a seed content of raffinose plus tachyose of less than 17 micromol/g, and a seed sucrose content of greater than 200 micromol/g, provided that the plant is not LR33), seeds crome the plant, making a soybean plant with the heritable phenotype (comprising crossing LR33 or the plant comprising the chimeric gene with a elite soybean plant and selecting a progeny plant of the cross of crome the plant made by the above method, a soy protein product derived from seeds of a soybean plant (homozygous for one or more gene encoding a companing step that has a heritable phenotype as mentioned above), seeds of soybean plant myo-inositol 1-phosphate synthase having decreased capacity for the synthesis of myo-inositol 1-phosphate, where the gene confers a complete phenotype as mentioned above), and making or producing a complete phenotype as mentioned above), and making or producing a complete sometime derived from seeds of a soybean plant with the heritable phenotype as mentioned above. The nucleic acid is useful for altering raffinose saccharide, sucrose, phytic acid and inorganic composition of soybean seeds thus leading to valuable and useful composition of the concentration of raffinose.
                                                       phosphate content of soybean seeds thus leading to valuable and useful soybean products, since the presence of high concentration of raffinose oligosaccharides in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence encodes a wild-type myo-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid encoding soybean myo-inositol 1-phosphate synthase, its complement, subfragment or the complement of the subfragment, operab
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      soybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-phosphate synthase having decreasing capacity for the synthesis for myo-inositol-1-phosphate. Also included are a chimeric gene (comprising the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 8; SEQ ID NO 9; 34pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Local Similarity
The invention relates to an isolated nucleic acid fragment encoding a soybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate synthase having decreasing capacity for the synthesis for myo-inositol-1-phosphate. Also included are a chimeric gene (comprising the nucleic acid encoding soybean myo-inositol 1-phosphate synthase, its complement, subfragment or the complement of the subfragment, operably linked to suitable regulatory sequences, where expression of the chimeric gene results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase), a soybean plant comprising the chimeric gene (with a heritable phenotype of a seed phytic acid content of less than 14.5 micromol/g, ased content of raffinose plus stachyose of less than 14.5 micromol/g, and a seed sucrose content of greater than 200 micromol/g, provided that the plant is not IR33), seeds from the plant, making a soybean plant with the heritable phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, useful for altering raffinose saccharide, sucrose phytic acid and inorganic phosphate content of soybean seeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 2; SEQ ID NO 1; 34pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (comprising crossing LR33 or the plant comprising the chimeric gene with CC an elite soybean plant and selecting a progeny plant of the cross of CC an elite soybean plant and selecting a progeny plant of the cross of CC crossing step that has a heritable phenotype as mentioned above), seeds CC from seeds of a soybean plant (homozygous for one or more gene encoding a CC mutant myo-inositol 1-phosphate synthase having decreased capacity for CC the synthesis of myo-inositol 1-phosphate, where the gene confers a CC heritable phenotype as mentioned above), and making or producing a CC heritable phenotype as mentioned above), and making or producing a CC soybean product derived from seeds of a soybean plant with CC heritable phenotype as mentioned above. The nucleic acid is useful for CC altering raffinose saccharide, sucrose, phytic acid and inorganic CC phosphate content of soybean seeds thus leading to valuable and useful CC soybean products, since the presence of high concentration of raffinose CC oligosaccharides in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence encodes a wild-type myo-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

```
Complement, subfragment or the complement of the subfragment, operably complement, subfragment or the complement of the subfragment, operably linked to suitable regulatory sequences, where expression of the chimeric gene results in a decrease in expression of an endogenous or native gene comprising the chimeric gene (with a heritable phenotype of a seed phytic acid content of less than 14.5 micromol/g, as eed content of raffinose plus stachyose of less than 14.5 micromol/g, and a seed sucrose content of crossing that that the plant is not LR33), seeds (comprising crossing LR33 or the plant with the heritable phenotype (comprising crossing LR33 or the plant with the heritable phenotype (crossing step that has a heritable phenotype as mentioned above), seeds of soybean plant made by the above method, a soy protein product derived from seeds of a soybean plant (homozygous for one or more gene encoding a complement myo-inositol l-phosphate synthase having decreased capacity for the synthesis of myo-inositol l-phosphate, where the gene confers a complement protein product derived from seeds of a soybean plant with the heritable phenotype as mentioned above), and making or producing a soybean product derived from seeds of a soybean plant with for altering raffinose saccharide, sucrose, phytic acid and inorganic contents of soybean products, since the greece of high concentration of raffinose oligosaccharides in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence encodes a mutant myo-inosphate synthase.
Sequence 1533 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, useful for altering raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean seeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol phosphate synthasis for phosphate synthase having decreasing capacity for the synthesis for inositol-1-phosphate. Also included are a chimeric gene (comprising inositol-1-phosphate.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 8; SEQ ID NO 5; 34pp; English.
                                                     inositol 1-phosphate synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2004-639957/62.

                                                                                                                                                                                      saccharide phenotype. Sequencing revealed a single base change mutation (G to T at base 1241) in the LR33 sequence. The mutation results in a seed phenotype of very low raffinose saccharide sugars, very high sucrose and low phytic acid. The nucleic acid is used to alter the raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean seeds, leading to useful soybean products, e.g. a seed phytic acid content of less than 17 ug/g, a seed content of raffinose and stachyose combined of less than 14.5 ug/g, and a seed sucrose content greater than 200 ug/g. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                             myo-inositol 1-phosphate synthase (MI 1-PS) present in clone p5bmi-lps (ATCC 97970). The clone was isolated from a CDNA library of soybean line LR13 by hybridisation to a probe made from MI 1-PS CDNA of Arabidopsis thaliana. MI 1-PS is involved in glucose metabolism to phytic acid, raffinose and stachyose. A mutant MI 1-PS nucleic acid (see AAV62443) has been identified in soybean line LR33, a mutagenised line of low raffinose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Soybean plants containing altered myo-inositol-1-phosphate gene - useful for generating plants with altered levels of e.g. raffinose, stachyose, phytic acid, etc.
                                                                                                                                                              Sequence 1782
                                                                                                                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of cDNA encoding the wild-type soybean
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hitz WD,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   á
                                                                                                                                                              The invention relates to a substantially purified nucleic acid molecule CC that encodes a cotton protein or its fragment comprising an EST CC (expressed sequence tag) appearing as ADP90990-ADP95919. Also included CC are a substantially purified cotton protein or its fragment encoded by a nucleic acid molecule which comprises: an exogenous promoter region which CC cacid molecule which comprises: an exogenous promoter region which CC functions in a plant cell to cause the production of a mRNA molecule; a CC structural nucleic acid molecule comprising one of the ESTs or their CC complements; a 3' non-translated sequence that functions in the plant CC ell to cause termination of transcription and addition of polyadenylated cribonucleotides to a 3' end of the mRNA molecule). The ESTs are useful as CC molecular tool for the targeting and isolation of novel genes for plant CC pathways, for isolating genes and promoters, for identifying and metabolic strategies for understanding critical plant developmental and metabolic pathways, for isolating genes and promoters, for identifying and mapping CC determining gene function. The cotton nucleic acid molecules are useful for determining if genes are members of a particular gene family and for use cin marker-assisted breeding programs. The present sequence is one of the CC in the specification but are available in electronic format from the CC USPTO at seqdata.uspto.gov/sequence.html?DocID=20040123338.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note="Vector: pBluescript II SK+; Site 1: BcoRI; Site 2: XhoI; The cDNA library was constructed from mRNA isolated from degenerating cotyledons of 9-10 day old etiolated seedlings for the cultivar Williams. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This were transformed into DH10B host cells (GibcoBRL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Shoemaker."

/clone="Gm-ri083"
/clone lib="Gm-ri083"
/note="The library Gm-ri083 is a sequence-driven, reracked /note="The library Gm-ri083 is a sequence-driven from commander for the progenitor library gm-closs from the progenitor library Gm-closs (from 2 to 3 week old whole plants of Williams); and 3055 sequences from library Gm-closs (from Supernod, plants whose seedlings were innoculated with Bradyrhizobium japonicum, courtesy of Dr. Gary Stacey). The 5' ESTs of the source clones from the different progenitor libraries was used to select singletons, or a representative of each contig, which were reracked for form library Gm-ri083. The cDNA clones of the reracked Gm-ri083 library were then sequenced at the 3' end. The contig analysis to select unique genes was performed by the laboratory of Ernest Retzel, Center for Computational Genomics and Bioinformatics, University of Minnesota, http://web.ahc.umm.edu/biodata/nnsfsoy/.

Reracking was performed by Incyte Genomics, St. Louis, http://www.incyte.com, and 3' sequencing by the Keck Center for Comparative and Functional Genomics, University of Illinois, http://www.lie.uiuc.edu/biodata/nnsfsoy/.

Note: The corresponding 5' EST from each clone in the Gm-ri083 library is listed in the 'OTHER EST' field. The detailed information on the source library for each clone clone can also be obtained by referring to the Incyte Genomics clone in the University of the corisinal cDNA library that is also listed under 'OTHER EST'."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Site 2: NotI; This cDNA library was constructed from mRNA isolated from hypocotyl and plumule tissues of seeds germinated for three days of the cultivar Williams. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a NotI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by digestion with EcoRI and NotI. The cDNA fragments were directionally cloned into the EcoRI-NotI restriction site of the pTTT3-Pac vector. The ligated cDNA fragments were transformed into DH10B host cells (Gibco BRI). This library was constructed by Dr. Randy Shoemaker."
